

Date	Time (Hour / s)	Description of Activity (WHAT)	Feedback received (SO WHAT)	Reflection (NOW WHAT)
27 - Oct - 2025	1:00	. Wrote the technical proposal for the web app. . Allocated subtasks on Jira based on the proposal plan.	. Mentor approved the proposal plan, and I proceed to create subtasks within the task created.	. This was the first time I am working with Jira – it is like Microsoft Planner. . However, it is more friendly in technical support compared to the former.
	4:00	. Seft-study on how to process raw images with OpenCV via LinkedIn Learning and worked with the provided exercises to strengthen foundation. . Collect raw images and process them based on the learned knowledge.		. Computer Vision is fresh to me as it is not included in either my major & minors. . Upon learning how to process images via education videos & official documents, I proceed to process the images with OpenCV and tested with many modern techniques like grayscale, increasing contrast for better image extraction.
	2:00	. I attended daily mandatory meeting session hosted by the HR department to learn about company history; its departments & introduced us (intern students) to every staff member working in the company.		. It helps me understand the goals that my placement company is aiming at, as well as the motivation behind them. . By knowing everyone, I understand that I could reach out one of them whenever I

				felt stuck at some point during my project at my placement company.
28 - OCT - 2025	2:00	. I attended daily mandatory meeting session hosted by HR department: to learn about the working culture within our placement company		. I learned that the company is focusing on work-life balance and concern for its staff's mental health by hosting a lot of events throughout the year to boost everybody's spirit.
	2:00	. Continuing my study on Computer Vision to train a YOLO model for identifying the Region of Interest (ROI).		. Through working with the exercises provided in the videos, I gain further knowledge and begin to apply those to my assigned project.
	3:00	. I wrote some code files based on the learned knowledge to train a YOLO model to detect the ROI in my assigned project & extract the labeled ROI from the input images via OpenCV & NumPy		. After completing this activity, my model is to be now able to detect the ROI on every input image & extracted those ROI into separated images for future debugging.
29 - Oct - 2025	2:00	. Attended daily mandatory meeting hosted by the HR Department: learnt and improve self-time management strategic with Kanban board, and 20-80 (Pareto) principle & did some exercises to strengthen our understanding upon these materials.		. With these tools, I will be applying these whenever I find that I will have to deal with several assigned tasks in the future but not now because our mentor wants us to focus entirely on our assigned project.

	2:00	. Continuing my studies by learning how to work with EasyOCR for extracting information from the extracted ROI images and work on the provided exercises		. Learnt on how to work with EasyOCR through LinkedIn videos & documents, I proceed to apply these to my current project through building a temporary pipeline to process the image.
	3:00	Build a temporary data pipeline that accepts image input to process the ROI & extract the information from the generated ROI images	. My mentor knew that I was still a fresher, thus, he went on telling me to spend more time on this task instead of rushing as he wanted to completely comprehend how data flow in this pipeline.	. Despite understanding how discrete code files work together, integrating them into a complete file is not a simple task. . I managed to complete the pipeline half a way and will try to complete it by tomorrow morning.
30 - Oct - 2025	2:00	. I attended daily meeting hosted by HR Department to learn how to write a proper Resume / CV for future application.		. I was introduced key points that employers tend to look for their ideal candidate & also got constructive feedback from peers & HR staff upon my initial CV – which I will used to polish mine to make it more appealing.
	3:00	. Finished the pipeline and proceeded to test it through terminal console & Postman		. As my temporary pipeline is working, I am ready to report this to my mentor to seek any further advice / feedback to improve it before

				moving to phase 2 of this project.
	1:30	. Implemented debug mode to my current pipeline based on my mentor feedback	. My mentor suggested that I should implement additional debugging features via URL to allow application developers to fully access the response information for debugging if necessary while keeping the response short and concise for non-developer usage	. I am glad to learn a new concept that is widely practicing in the modern industry. . Thus, I proceeded to find a way to implement this, and it took me a while to figure it out that I need to revise my knowledge upon network from SIT202.
31 - Oct - 2025	2:00	. Attended the last daily meeting with HR staff to learn on how to have a good interview.		. I learnt that the first impression is important besides having a good CV and how an interviewee performing during an interview session is important as well. . I will start practicing interview through a mirror weekly to prepare for the future.
	2:00	. Performed additional training for the current YOLO model as it still detecting wrong information.		. I learnt that training an AI model for detecting ROIs will require a huge amount of data to increase the confidence score which is correlated to the precision of the data being

				extracted by the pipeline.
	3:00	. Tried applying new methods to process the image to improve the data extraction by the pipeline – suggested by my mentor	. My mentor suggested that I should apply other modern methods to see if these will greatly help with the precision.	. I followed his suggestions and tested my temporary pipeline with grayscale, eliminating background context and found that these reduce the precision instead of improving. . Further research, I found that EasyOCR is good at differentiating colors, henceforth, processing extracted ROI regions with grayscales is too brutal and ineffective compared to the original approach.
03 - Nov - 2025	3:00	. Learn how to work with FastAPI through reading its official documents and testing out its functions via providing examples.		. Even though I have completed SIT331 at Deakin, however, FastAPI is a new concept, thus, I will take my time to fully understand the general mechanism behind it which I forgot & missed during my enrolled for the above unit.
	3:00	. I applied those learned concepts into my own project by building a FastAPI -		. Based on what I learnt, I go on and create the endpoints for /upload for my

		Uvicorn Server as my project backend.		backend server & /upload with debug feature and testing those with Postman.
	1:00	. Review Data Structure and Algorithm (DSA)		. Whenever I cannot longer focus on my project, I will shift it to review DSA for technical interview.
04 - Nov - 2025	3:00	. Intergrating the OCR pipeline created from last week into the FastAPI - Uvicorn backend		. By completing this activity, I have a rough template for the future projects which I can always revisit whenever I forget or encounter bugs while developing a backend server.
	1:00	. Research on determining which database should be appropriate for the project since it will be deployed on a remote server as the final step.		. Upon completing this activity, I learnt to identify which database type is best fit for my project through researching online resources and reading official document.
	2:00	. Design a rough database and set up Docker container that housing the backend database.	. My mentor approved my choice for database upon listening to my reason.	. I learned that deploying a server database through traditional PostgreSQL would not be ideally in my case since this project is more of teaching me on how to work on a real project and scalability should not be one of the main goals in this internship.

	1:00	. Review Data Structure and Algorithm (DSA)		. Whenever I cannot longer focus on my project, I will shift it to review DSA for technical interview.
05 - Nov - 2025	1:00	. Design a rough algorithm for checking lottery-winner prizes through whiteboard		. This is a standard practice for implementing a solution from paperwork into technology - a crucial step which explains why Leetcode or similar platform is still relevant in every technical interview.
	2:00	. “Translate” the paperwork idea into code-based solution and test this algorithm with some default test case.		. Coming up with theoretical solution is good - however, translating it into a practical one through code is a different story because picking a right syntax will greatly simplify the original concept into a simple algorithm that everyone can catch up with.
	3:00	. Integrate the code-based solution into the temporary pipeline and fix bugs.		. Due to the algorithm requiring a different input compared to the one given from the current pipeline, I will need to do some research to adjust the pipeline to yield the correct input format before integrating the

				algorithm into the pipeline.
	1:00	. Review Data Structure and Algorithm (DSA)		. Whenever I cannot longer focus on my project, I will shift it to review DSA for technical interview.
06 - Nov - 2025	2:00	. Continue my integration of algorithm into the pipeline as I could not complete in the previous day as my mental is exhausted.	. My mentor suggested me to find a way to populate the database without the need of manually input	. As I completed this activity, I proceeded to do research on how to code for a web scraper that will automatically extract data from a website daily at a certain time.
	5:00	. Learn to how code for a web scraper via LinkedIn Learning videos and practice my newfound knowledge via provided exercises.		. I understand that research, trials and errors are the common things to see and expected in developing software or an application. Hence, no one should feel embarrassment if he / she does not know how to code / do something but rather self-engaging in finding a solution is the good practice that developers should follow.
07 - Nov - 2025	3:00	. Continuing my study and research on developing a web scraper & testing out with simple html-structure website.		. I understand that failures are a common thing in developer route and we should not take it too seriously as it can affect negatively to our mental health. In addition, I learned

				to relax my mind a bit before heading back for another trials.
	4:00	. Participate in company event for celebrating men day.		. I got a good chance to forming network and bond with seniors in my placement company while enjoy myself with fun activities after days of working non-stop on my assigned project.
